Week 11 Logbook

On this week I learn a lot about daemon processes.

1. Daemon process created with disown or nohup will have its' ppid the terminal that it runs from. If the terminal is closed, then it will be adopted by init and become a true daemon process.
2. Daemon process created with disown or nohup will continue its' old terminal session after the terminal is closed, while daemon created by setsid will creates a new session.
3. Creating a daemon process in bash is by using & on a function
4. After running a & on a function inside a bash script, the daemon process will only inherit everything inside that function.
